🔥 DEV.TO: dev.to/rdin777

PROFESSIONAL SUMMARY

Security Researcher specializing in Web3 and DeFi protocol security. Practical experience in smart contract analysis using static analysis tools (Slither, Mythril) and dynamic testing frameworks (Foundry). Active open-source contributor to defi-security-blueprint, focusing on CEX interface auditing and technical documentation. Published 15+ technical articles on DEV.TO covering real-world exploits, vulnerability analysis, and security best practices. Seeking a Security Researcher or Junior Smart Contract Auditor role to apply technical expertise in protecting users and protocols.

Target Position: Security Researcher / Junior Smart Contract Auditor

Availability: Immediate

CORE COMPETENCIES

Smart Contract Security:

Vulnerability detection: reentrancy, access control, logic flaws, oracle manipulation

DeFi protocol analysis: AMM (Curve, StableSwap), lending protocols, derivatives

Static analysis: Slither, Mythril

Dynamic testing: Foundry (fork tests, fuzzing)

Code review: Solidity, Cairo (Starknet)

Development & Tools:

Solana ecosystem (whale tracking, sniper bots, Jito integration)

Real-time monitoring systems (anomaly detection, RAM optimization)

Open-source contribution and documentation

Hardhat/Foundry (intermediate)

Technical Writing & DevRel:

15+ published technical articles on DEV.TO

Exploit analysis and case studies

Security best practices documentation

Open-source repository maintenance

Languages:

Russian (Native)

English (Technical: documentation reading, code writing, technical articles published in English)

SELECTED PUBLICATIONS

Featured Articles (DEV.TO):

"How a Single JavaScript File Bypassed a \$15B Multi-Sig: Anatomy of the Bybit Hack"

Detailed analysis of the Bybit exploit, JavaScript attack vector breakdown

EXPERIENCE & PROJECTS

Independent Security Researcher | 2025 – Present

Conduct smart contract audits for DeFi protocols (Curve, Convex, Aave, Panoptic, lending platforms)

Analyze real-world exploits and publish detailed technical breakdowns

Develop custom security tools: DeFi-Sentinel (real-time anomaly monitoring), Solana Whale Tracker

Create stateful fuzzers for testing mathematical invariants in AMM protocols

Perform Foundry fork tests to track state and supply changes in production protocols

Open-Source Contributor | [defi-security-blueprint](https://github.com/rdin777/defi-security-blueprint)

Expand repository functionality for CEX and DeFi protocol auditing
Develop security checklists and auditing methodologies
Write and maintain technical documentation for developers and auditors
Share security best practices with the Web3 community
Technical Writer & Content Creator | DEV.TO
Publish in-depth technical articles on smart contract security and DeFi vulnerabilities
Cover diverse topics: Solidity, Cairo/Starknet, Solana, Ethereum L2s
Analyze major exploits (Bybit, Ekubo, Ostium) and provide prevention strategies
Build educational content for the security research community

EDUCATION

Continuous Learning & Professional Development
Cyfrin Updraft (Foundry Fundamentals)
Ethernaut, Damn Vulnerable DeFi (completed challenges)
Self-directed study: Solidity, Cairo/Starknet, ZK-proofs, DeFi security

CERTIFICATIONS

Foundry Fundamentals | Cyfrin Updraft
Verification ID: 29IAKUC7PD3N
View Achievement: <https://profiles.cyfrin.io/u/rdin35051/achievements/foundry>

FEATURED SECURITY RESEARCH & AUDITS

Starknet Staking Protocol | L2 Security Research
Deep dive into staking mechanics and validator economics
Identified edge cases in staking/unstaking flows (245+ contract clones analyzed)
Published technical breakdown on DEV.TO
Monetrix Protocol | Smart Contract Audit
Discovered Critical surplus double-counting vulnerability
Prevented potential fund loss through early detection
Provided detailed remediation recommendations
Aave V4 & KelpDAO/rseth | Architecture Review
Detailed post-mortem analysis of \$195M liquidation deadlock scenario
Comprehensive security analysis of LST (Liquid Staking Token) mechanisms
Risk assessment and design vulnerability documentation
Merkle Mixer | Zero-Knowledge Protocol Research
Privacy-preserving protocol vulnerability research
Analyzed ZK-proof implementation and potential attack vectors
Documented security considerations for mixer protocols

ADDITIONAL INFORMATION

Remote Work: Fully equipped for remote collaboration (GitHub, Telegram, documentation tools)
Time Zone: EET (UTC+2), flexible for international teams
